Generative AI for Engagement Managers

Optimizing Delivery and Operations

Ricardo Reyes-Jimenez

Capgemini

28 de agosto de 2026

Session Objective

By the end of this module, the Engagement Manager (EM) will be able to:

1. Understand what Generative AI is and how Large Language Models (LLMs) operate. 2. Identify daily use cases in the project lifecycle (Sales, Delivery, Operations). 3. Apply strict **Security and Privacy** principles when interacting with AI tools in corporate environments.

1. Fundamentals: What is Generative AI?

It is not magic, it is probability on a massive scale.

- **Artificial Intelligence (AI):** Systems that mimic cognitive capabilities.
- **Generative AI:** A branch that creates *new* content (text, code, images) from existing data.
- **Microsoft Copilot:** Your primary AI assistant. As EMs, you are equipped with the standard MS Copilot license. This means you interact with state-of-the-art models (like GPT-5.2) through a chat interface, without the ability to build custom agents or specialized studio tools Microsoft (2025).
- **Myth:** AI "knows" things.
- **Reality:** AI calculates which word has the highest probability of following, based on billions of statistical parameters and your prompts.

EM Use Cases (Sales & Pre-Sales)

How does AI optimize the early stages of the lifecycle?

- **RFP (Request for Proposal) Analysis:** Extracting key requirements from 200-page tenders in minutes.
- **Value Proposition Drafts:** Generating the baseline for an Executive Summary highlighting Capgemini's differentiators.
- **Risk Brainstorming:** Identifying potential project risks before signing based on similar industries.

EM Use Cases (Delivery & Operations)

The day-to-day of the EM and how to lighten the operational load:

- **Contract Management (SOWs):** Summarizing obligations, milestones, and SLAs to align the technical team.
- **Strategic Communications:** Drafting difficult emails to clients (e.g., justified delays, *Scope Creep*).
- **Executive Reporting:** Transforming raw weekly meeting notes into polished and structured *SteerCo Reports*.
- **Conflict Resolution:** Red Teaming simulations to prepare for difficult negotiations.

Exercise 1: Email Summarization & Action Plan

Context: A client sends a long, emotional email complaining about a delayed milestone and subtly requesting three new features out of scope. **Task:** Use Copilot to extract the core issues and draft a professional response.

- **Draft Prompt to Try:**

"Act as a Capgemini Engagement Manager. Read the following client email [Paste Email]. Summarize the top 3 complaints. Then, draft a polite, solution-oriented response acknowledging the delay, but firmly clarifying that the new features require a Change Request (CR)."

Security & Privacy (The Golden Rule)

As an Engagement Manager, you are the guardian of client data.

Tool Type	Examples	Risk	Golden Rule
Public (Free)	ChatGPT (Free), Gemini (Free)	High. Data trains the model.	**NEVER** enter confidential data, Client Names, SOWs, or financials.
Enterprise Licensed	**MS Copilot (Your License)**	Low. Data does not train the base model.	Follow Capgemini's Cybersecurity policy. Safe for project data, but still rely on MS Learn guidelines for data governance.

- **Note on Custom Agents:** With the standard Copilot license, you cannot create custom Copilot Studio agents. You must maximize your productivity through pure Prompt Engineering in the standard chat interface and by leveraging **MS Learn** resources.

The Role of the "Human in the Loop"

The final responsibility for any deliverable, code, or email generated by AI remains yours.

- AI is an excellent assistant (A 24/7 Junior Assistant).
- AI suffers from **Hallucinations** (it invents data when it doesn't know the answer with certainty).
- **Usage Protocol:**

1. Generate the draft with AI. 2. Verify facts and figures by cross-referencing the original document. 3. Add the human touch (empathy and business context).

Exercise 2: Key Points Extraction (Requirements)

Context: You are handed a messy list of requirements or a raw Excel export for a new phase of the project. **Task:** Extract the most critical risks and deliverables for the EM to monitor.

- **Draft Prompt to Try:**

"Review the following raw list of project requirements [Paste Text]. Identify the top 5 most critical deliverables that carry the highest operational risk for our delivery team. Present them in a table, including a suggested mitigation strategy for each."

Exercise 3: Data "Sanitization"

Before sending to the AI (if using non-secure tools):

- *Original:* "The client BancoEstado owes us $50,000 USD for Milestone 3 of the CoreBanking project."
- *Sanitized:* "The client [BANKING_CLIENT] owes us [AMOUNT] for [MILESTONE] of the [TECH_PROJECT]."

Best Practices: Create your own mental "anonymization dictionary" before copy-pasting a corporate email into the chat.

Recap & Next Session

Today we learned:

- Generative AI predicts text based on context.
- It can accelerate pre-sales, delivery, and project management.
- **Client data security is non-negotiable.**

Next Session: *Module 2: Basic Prompt Engineering and Key Frameworks.* We will learn to stop asking AI for things as if it were Google and start programming it using natural language.
