Module 7: Information Retrieval

Leveraging MS Learn via Copilot

Ricardo Reyes-Jimenez

Capgemini

28 de agosto de 2026

Session Objective

By the end of this module, the Engagement Manager will be able to:
1. Understand the limitations of standard Copilot for internal document retrieval.
2. Use Copilot to effectively query and summarize official **MS Learn** documentation. 3. Translate complex technical concepts for non-technical stakeholders.

1. Information Retrieval Reality for EMs

You have standard Copilot, not a custom Agent.

- **The Limitation:** You cannot train the model on thousands of internal Capgemini PDFs permanently.
- **The Workaround:** You must bring the context *to* the chat, or direct Copilot to search the public web strategically (e.g., querying 'learn.microsoft.com') Microsoft (2025).
- **The Value:** EMs often need to justify architectural decisions or compliance standards to clients. MS Learn is the ultimate source of truth for Microsoft ecosystem projects.

Exercise 1: Policy Retrieval from MS Learn

Context: The client is nervous about data governance in their new Azure deployment. You need the latest official Microsoft stance to reassure them. **Task:** Prompt Copilot to search MS Learn and summarize the governance best practices.

- **Draft Prompt to Try:**

"Search Microsoft Learn documentation for the latest best practices on 'Azure Data Governance'. Summarize the top 3 principles in a professional, reassuring email directed to a client's Chief Risk Officer. Include the source links at the bottom."

2. Bridging the Technical Gap

Engagement Managers are the bridge between developers and the business.

- Developers speak in acronyms; clients speak in ROI and Risk.
- Copilot excels at analogy generation and technical summarization, making you a more effective communicator.

Exercise 2: Technical Summarization via Analogy

Context: Your technical lead insists on refactoring a monolithic application into microservices, but the client doesn't understand why it costs $50,000 and delays the project. **Task:** Use Copilot to explain the concept using a relatable business analogy.

- **Draft Prompt to Try:**

"Explain the technical difference between a 'Monolithic Architecture' and 'Microservices'. Do not use heavy IT jargon. Instead, use an analogy related to managing a large corporate restaurant or kitchen. The goal is to justify to a non-technical CEO why migrating to microservices is worth the upfront investment."

Recap & Next Session

Today we learned:

- How to direct Copilot to authoritative sources like MS Learn.
- How to use AI to translate dense technical architecture into business-friendly analogies.

Next Session: *Module 8: Final Integration (Role-Play).* The ultimate test. We will run a multi-step crisis simulation combining SOW analysis, Scope Creep detection, and diplomatic communication.
